Breach Detection Agents Designed to Help You Fight Back

When you are under attack, every second counts. Protect your organization with a system built for immediate breach detection. Discover how our unique software is able to detect unauthorized activity and provide you with instant alerts for a fast incident response.

Don’t just defend. Set a trap.
Today, it can take well over 191 days, despite our best practices, advanced defenses and threat intelligence, to detect an attacker inside your networks.

**SOMETIMES TO CATCH A THIEF...**

Nightingale uses the attacker’s own approach to detect their presence and dramatically reduce detection times. Our platform was designed by cyber attackers, to catch cyber attackers.

Sensato-Nightingale was developed to be easy to deploy, manage and use. The platform can be deployed in a matter of minutes and provides support for both self-managed and Microsoft Azure environments. Most of all Sensato-Nightingale is designed to evolve.

Immediately upon detecting a breach, Sensato-Nightingale will alert its Nest Command Center and issue SMS and e-mail alerts. Sensato-Nightingale can also be connected to the Sensato Cybersecurity Tactical Operations Center (CTOC) for enhanced monitoring and incident response.

Nightingale’s Sentinel module allows you to immediately activate network traffic monitoring, which will track and follow all activity related to the attacker’s IP. This is an amazingly powerful resource for forensic analysis and incident response.

Sensato-Nightingale is one of the first tools to provide the ability to launch automated counter-measures against an attacker. This unique capability is extremely powerful and can help you fight back.
